

# Incontinence is now easier to treat™

## *Add sEMG to your treatment regimen and add quality to your patient's lives*

**T**he US. Department of Health & Human Services' Clinical Practice Guidelines recommend non-invasive behavior modification techniques, such as surface electromyography (sEMG), as first-line therapy for incontinence. With built-in protocols to assist the clinician, our advanced sEMG system is easy to incorporate into your practice.

### **MyoTrac 3G™ for portable assessment and training**

MyoTrac 3G provides clinicians with graphical displays, either in the unit alone or connected to a Windows®-compatible PC, to analyze and monitor pelvic floor muscle activity for the treatment of incontinence and other urology problems. Built-in memory allows practitioners to record and download session data to a PC.

### **MyoTrac 3™ for clinical assessment and training**

MyoTrac 3 is a highly sensitive dual-channel sEMG unit, which enables clinicians to customize patient assessment and training regimens for incontinence. MyoTrac 3 can be connected to any Windows®-compatible PC for easy real-time monitoring or data analysis with our Continence Software.

### **U-Control™ for home training**

U-Control is a sophisticated, yet simple to use, battery-operated unit. U-Control enables patients to self-train with prescribed exercises to re-educate pelvic muscles.

With our sEMG feedback equipment, clinicians and patients can successfully treat: stress incontinence, urge incontinence, and fecal incontinence.
